**Work Supports**

**off-position extended – contact by spring force, single acting, max. operating pressure 500 bar**

**Application**
Hydraulic work supports are used to provide a self-adjusting rest for the workpiece during the machining operations. They compensate the workpiece surface irregularities, also deflection and vibration under machining loads.

**Description**
The spring-loaded plunger positions itself against the workpiece with an adjustable light spring force. Hydraulic locking is made together with hydraulic clamping of the workpiece, or independently. The support plunger is provided with female thread to enable the use of threaded pieces for height adjustment. Oil supply can alternatively be effected from the side or from below.

The internal part of the work support is protected against dust and swarf by a sintered metal air filter.

Recommended minimum pressure 100 bar, spring force adjustable from 10 to 90 N, depending on stroke.

**Important notes!**
If there is any danger of fluids being sucked into the filter, a vent hose has to be connected.

Spring force should not be used to lift workpieces.

Contact bolts and extensions with large weight can influence the functions of this component.

Work supports are not suitable to compensate side loads. Operating conditions, tolerances and other data see data sheet A 0.100.

It is absolutely necessary to follow the instructions for venting of the spring area on data sheet A 0.110.

**Accessory**
Capstan nut
